

Nagios Graph Downloader

A simple application to download host availability graphs

NOTE: Requires the .NET Framework 4 to be installed!

How to use:

The process should be fairly self-explanatory.

1. Click Browse... to choose a folder where your graphs will be saved
2. Choose a starting date for the graphs
3. Choose the end date for the graphs
4. Choose a host group to use, from the drop down list
 - a. The Yellow Cabs host group has been pre-programmed for use.
 - b. Choosing Custom will show a new window where you can load a new host file. This file must be plain text with a number of Nagios host names, one per line.
5. Click Download to start the job, then click Begin to start the download
 - a. The download may take some time, and the application may appear to "hang" thanks to the Nagios server's less-than-prompt replies. Leave it run and once it's done, you should see all your host names in the Completed box and click OK to close the job.
6. Click the settings button (in the title bar of the main window) to change the server address or login details.

This application is not especially error-tolerant so don't do anything stupid, especially if you're using custom host groups. Make sure you can access the server and the login details are accurate if you're having problems.
